The CKGF superfamily comprises at least four families of growth factors: the glycoprotein hormones, the platelet-derived growth factor (PDGF) family, the neurotrophins and the transforming growth factor-beta family; the families are known to be structurally similar (especially comprising the cystine knot topology) and it was shown that mutations at certain positions in the CKGF hairpin loops of family members and other members of the CKGF superfamily could significantly alter the biological activities of the CKGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WO200017360-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This is the wild type human activin A subunit.

Mutants comprise at least one electrostatic charge altering mutation in a beta hairpin loop, resulting in increased bloactivity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New mutant cystine knot growth factor proteins comprising one or more mutant subunits, useful for treating or preventing diseases e.g. hypothyroidism and thyroid cancer

Title: . Perfect score: US-09-684-383-2 1849

1 MTSSLLLAFLLLAPTTVATP......DSNIVKTDIPDMVVEACGCS 352

Scoring table:

BLOSUM62 Gapop 10.0 , Gapext 0.5

Searched: 105224 seqs, 38719550 residues

Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0
Maximum DB seq length: 2000000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Database : SwissProt_40:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch).	INLIBINS/ACTIVINS ARE INVOLVED IN REGULATING A NUMBER OF DIVERSE FUNCTIONS SUCH AS HYPOTHALAMIC AND PITUTTARY HORMONE SECRETION, GENORADAL HORMONE SECRETION, GENORADAL HORMONE SECRETION, GENORED TO AN ATURATION, IENTERRENTIATION, INSULIN SECRETION, NERVE CELL SURVIVAL, EMBRYONIC AXIAL DEVELOPMENT OR BONE GROWTH, DEPENDING ON THEIR SUBURIT COMPOSITION. INHIBINS APPEAR TO OPPOSE THE FUNCTIONS OF ACTIVINS. -1. SUBURIT: HOMODIMERIC OR HETERODIMERIC THROUGH ASSOCIATION WITH ALPHA AND BETA SUBURITS, LINKED BY ONE OR MORE DISULFIDE BONDS. INHIBINS ARE HETERODIMERS OF ONE ALPHA AND ONE BETA SUBURIT. ACTIVINS ARE HOMO-OR HETERODIMERS OF BETA SUBURITS ONLY (BY SIMILARITY). SIMILARITY: BELONGS TO THE TGF-BETA FAMILY.	SEQUENCE FROM N.A. "Genes coding for mouse activin beta E are closely linked and exhibit a liver-specific expression pattern in adult tissues.";

Biochem. Biophys. Res. Commun. 231:655-661(1997).

-!- FUNCTION: INHIBINS AND ACTIVINS INHIBIT AND ACTIVATE,

RESPECTIVELY, THE SECRETION OF FOLLLITROPIN BY THE PITUITARY GLAND.

INHIBINS/ACTIVINS ARE INVOLVED IN REGULATING A NUMBER OF DIVERSE FUNCTIONS SUCH AS HYPOTHALAMIC AND PITUITARY HORMONE SECRETION,

GONADAL HORMONE SECRETION, GERM CELL DEVELOPMENT AND MATURATION,

ERYTHROID DIFFERENTIATION, GERM CELL DEVELOPMENT AND MATURATION,

ERYTHROID DIFFERENTIATION, GERM CELL SURVIVAL,

EMBRYONIC AXIAL DEVELOPMENT OR BONE GROWTH, DEPENDING ON THEIR SUBUNIT COMPOSITION. INHIBINS APPEAR TO OPPOSE THE FUNCTIONS OF

Submitted (APR-1999) to the EMBL/GenBank/DIBJ databases.

11- FUNCTION: INHIBINS AND ACTIVINS INHIBIT AND ACTIVATE,

RESPECTIVELY, THE SECRETION OF FOLLITROPIN BY THE PITUITARY GLAND.

INHIBINS/ACTIVINS ARE INVOLVED IN REGULATING A NUMBER OF DIVERSE FUNCTIONS SUCH AS HYPOTHALAMIC AND PITUITARY HORMONE SECRETION,

GONADAL HORMONE SECRETION, GERM CELL DEVELOPMENT AND MATURATION,

ERYTHROID DIPFERENTIATION, INSULIN SECRETION, NERVE CELL SURVIVAL,

EMBRYONIC AXIAL DEVELOPMENT OR BONE GROWTH, DEPENDING ON THEIR SUBBUNIT COMPOSITION. INHIBINS APPEAR TO OPPOSE THE FUNCTIONS OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Rattus norvegicus (Rat).
